

Web Hosting – Which One Should I Choose.

The primary task of a web hosting provider is to provide ample server space, offer best web services and proper maintenance of servers. There are two different varieties of web hosting services offered by companies. These are shared hosting and dedicated hosting. For more details visit <http://planetonline.net>

Now let us look at each of them in detail:

Shared hosting: Shared hosting, also popularly known as virtual hosting is one of the mostly commonly provided web hosting services. In this system, the equipment and server are owned by the web host company. It usually places your content and applications on a common server which is shared by all the other customers utilising the services of the same web host.

The main advantage of having shared web host is that it is affordable and efficient in terms of performance. The server helps you review the performance of your site using the control panel provided by the web host company. However, the only limitation with this kind of system is that it prevents you from using certain scripting languages and applications. PlanetOnline.net offers some great shared web hosting packages.

Dedicated hosting: This is an advanced kind of web hosting that allows you to hire an entire server and then have access to all its resources. In this kind of system, the web host gives you a free hand to manage and install scripts and softwares on the server.

The main benefit of having this system is that it includes high quality infrastructure, high speed connectivity and most importantly it is very safe. Unlike other hosting systems, it allows the operation of CPU intensive applications without any hurdles. This kind of plan is suitable for companies that have large scale of operations and high customer traffic on their sites. PlanetOnline.net has customized packages for Dedicated Web Hosting

Root Server hosting: Also popular as semi managed hosting, this system allows you to control your server by providing access to root. This is also a very safe, reliable hosting system that offers flexibility in terms of operation. This is perfect for people in search of customised plans.

Reseller hosting: As the name denotes, this kind of system allows you to enter a contract with web hosting company and then resell their services under your own brand name. This is ideal for companies that look to host on behalf of their clients. Become a Reseller using state of the art Web Hosting Services from PlanetOnline.net

Finally we would like to conclude stating that the ultimate choice lies in the hands of the client depending on his specific requirements. For more details visit planetonline.net
